Microfibrillated Cellulose for Next-generation Sustainable Packaging

Presented by:

Tom Larson

Co-authors: Per Svending, Mark Paradis, Robyn Hill, Tania Selina

FiberLean Technologies

FiberLean® Technologies

Innovative by Nature.

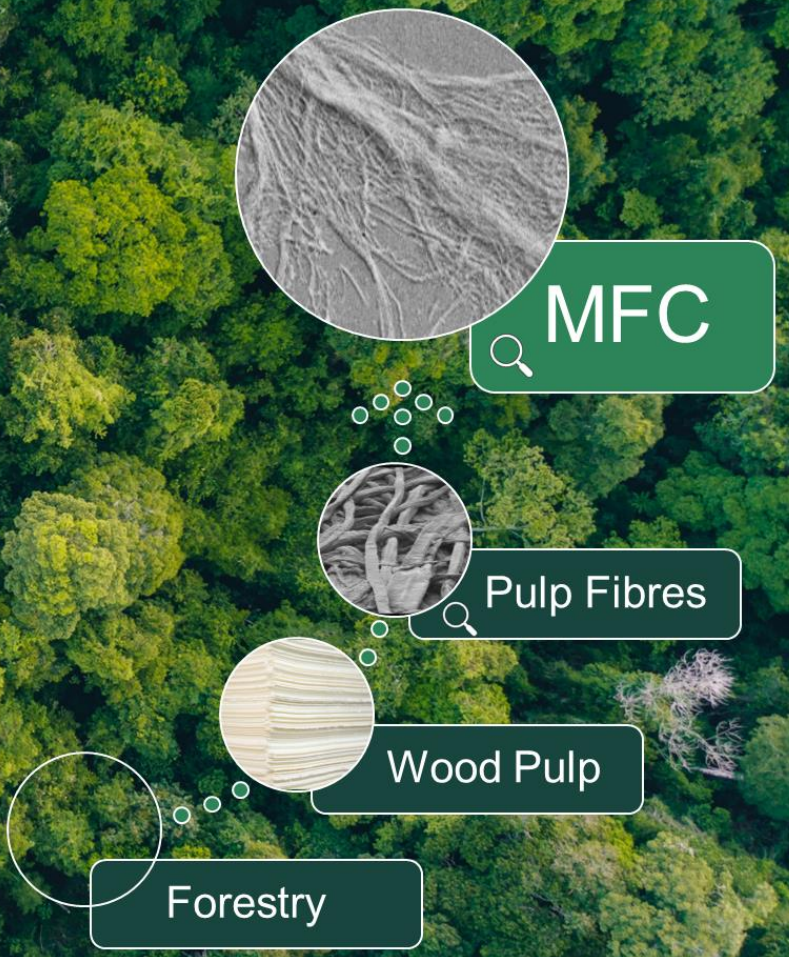
Cellulose is the most **abundant** and **renewable** natural polymer on **Earth**.

Through controlled processing, wood pulp fibres can be converted into small networks of fibrils, known as:

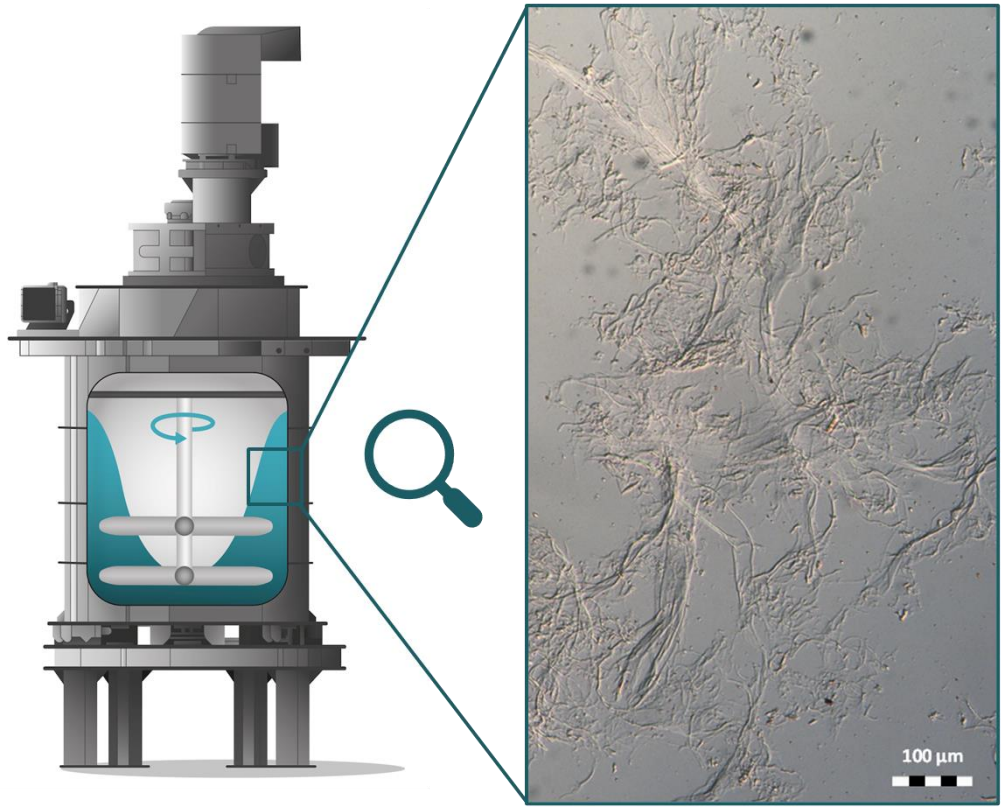
Microfibrillated Cellulose (MFC)

This unique **biomaterial** is used as an additive across multiple product manufacturing industries, enabling users to:

- ✓ **Improve properties and quality**
- ✓ **Reduce costs**
- ✓ **Achieve sustainability goals**
- ✓ **Develop new products**



Ultra-fine grinding technology for efficient MFC production at scale



The unique grinding process:

Creates interconnecting fibre

Networks

that are highly-fibrillated for

Strength

maximising MFC product

Performance

The **robust grinding** process transforms fibres through **milling** with carefully **controlled intensity**, liberating an **optimal "micro fibrillated" network** structure.

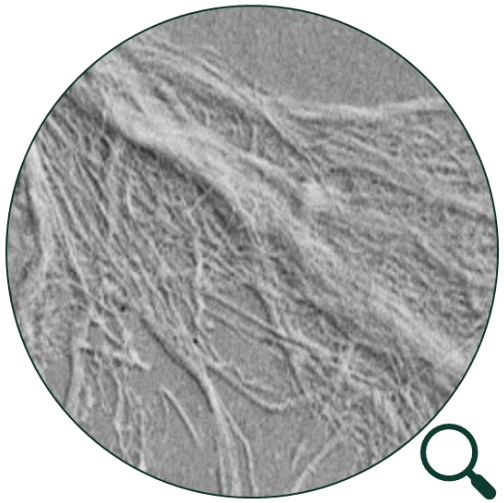
Onsite MFC Production

- ✓ High-throughput continuous operation.
- ✓ Low maintenance costs and high uptime (>95% plant availability).
- ✓ Chemical-free process.
- ✓ Highly-automated modular plant design with online monitoring.
- ✓ 1 grinding module = ~1,000 dmt MFC/year.

Prepared as low solids slurry

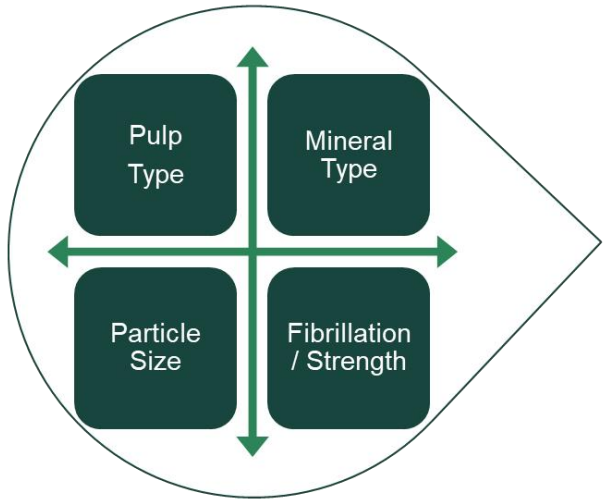
- Highly viscous MFC suspension in water.
- ~1% to 2% solids content (based on fibre).

Properties



- Web-like network structure.
- High aspect ratio.
- Very high surface area.
- Recyclable, biodegradable & compostable.
- Food contact safe.

Product variety



- Varied levels of fibrillation and particle size distribution.
- Most pulp types can be used, including recycled feedstocks.
- MFC composites with minerals can also be prepared.

3 product families

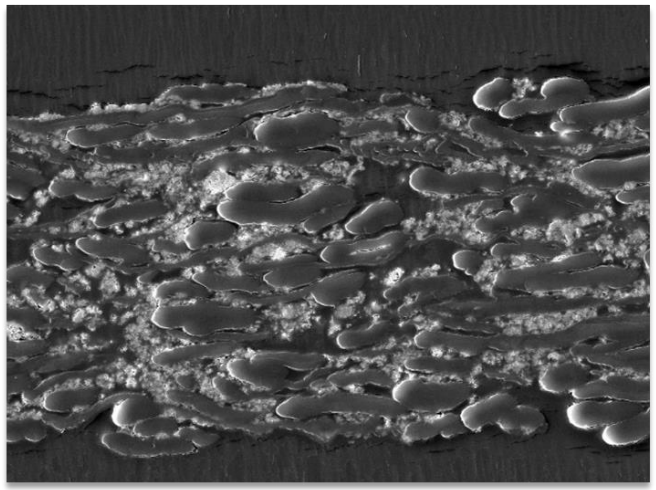
MFC from virgin wood pulps

MFC-mineral composites

MFC from recycled feedstocks

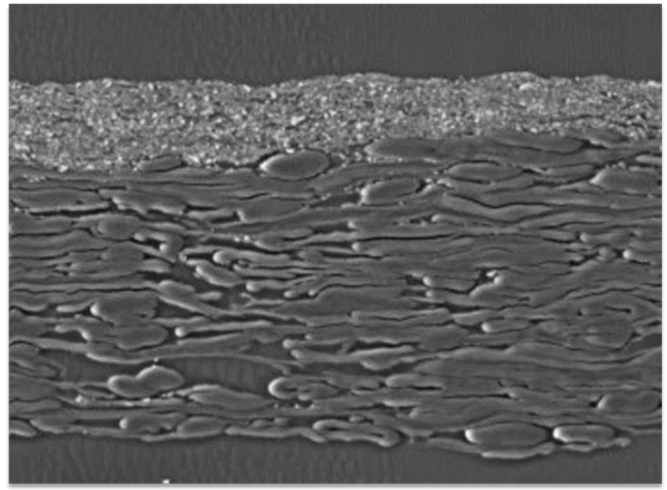
MFC applications in paper and board

In the sheet…
“Internal application”



- MFC is mixed into the pulp stock to provide increased web bonding.

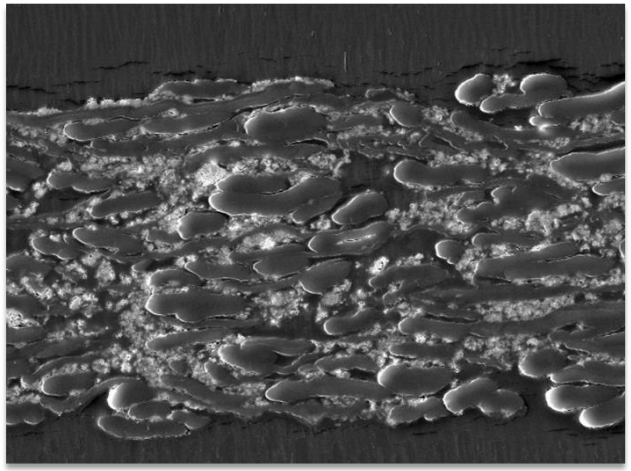
On the sheet…
“Surface application”



- MFC is coated onto the surface to improve barrier properties.
- Or where MFC is used as the sole binder for a mineral coating.

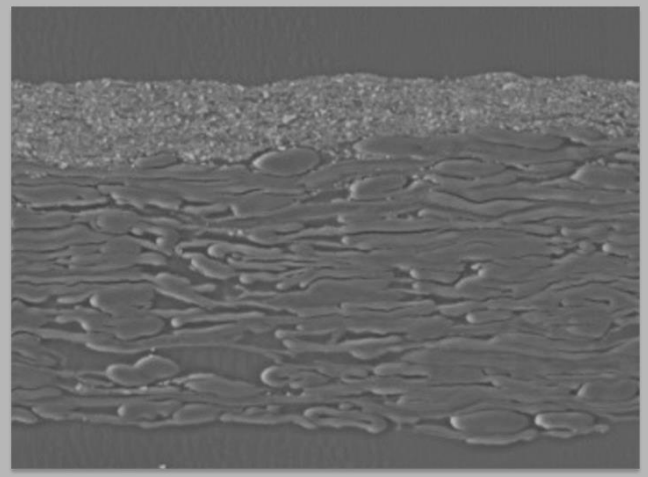
MFC applications in paper and board

In the sheet…
“Internal application”



- MFC is mixed into the pulp stock to provide increased web bonding.

On the sheet…
“Surface application”



- MFC is coated onto the surface to improve barrier properties.
- Or where MFC is used as the sole binder for a mineral coating.

Add MFC into the base paper furnish "**Internal Application**":

IMPROVE PROPERTIES

- Increase web strength (wet & dry).
- Porosity control & coating hold-out.
- Improve stiffness.
- Improve fold-cracking resistance.
- Improve print quality.

REDUCE RAW MATERIAL COSTS

- Replace fibre with filler.
- Reduce Softwood consumption.
- Light weighting / dematerialization.
- Reduce chemical consumption.
- Reduce starch dependency.

GAIN EFFICIENCY

- Reduce web breaks.
- Improve retention.
- Increase machine speed.
- Reduce steam consumption.
- Reduce refining energy.

IMPROVE SUSTAINABILITY

- Improve quality of recycled feedstocks.
- Use more recycled material.
- MFC is: Recyclable, repulpable, biodegradable and compostable.

Container board

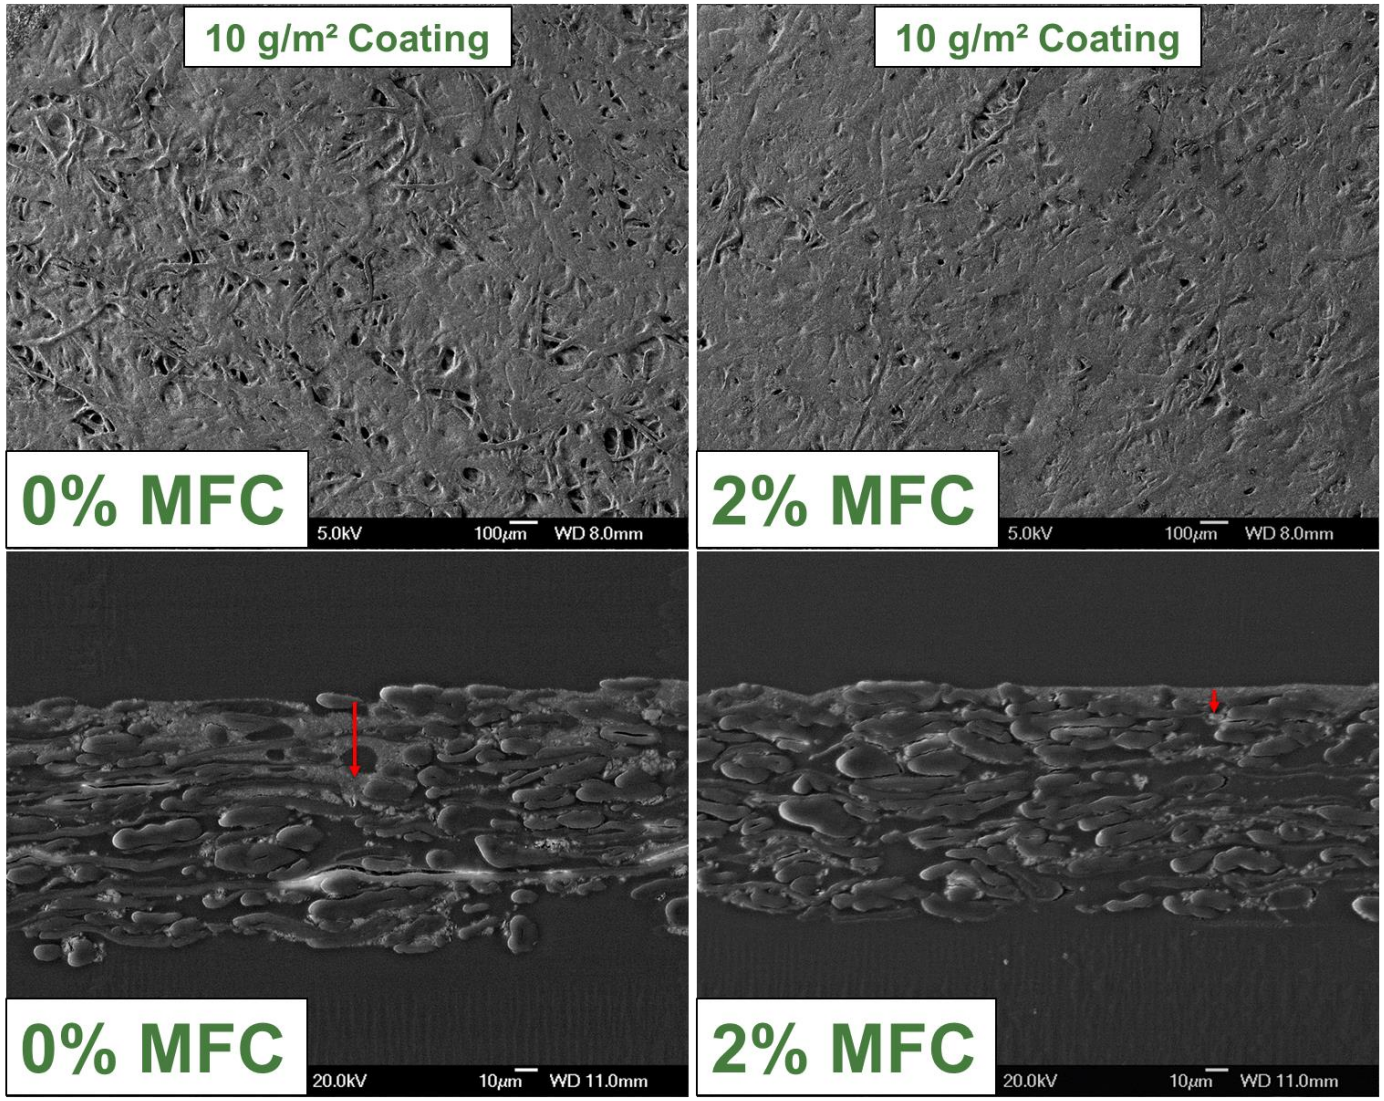
3D Moulded Fibre

Internal application of MFC to improve coating hold-out:

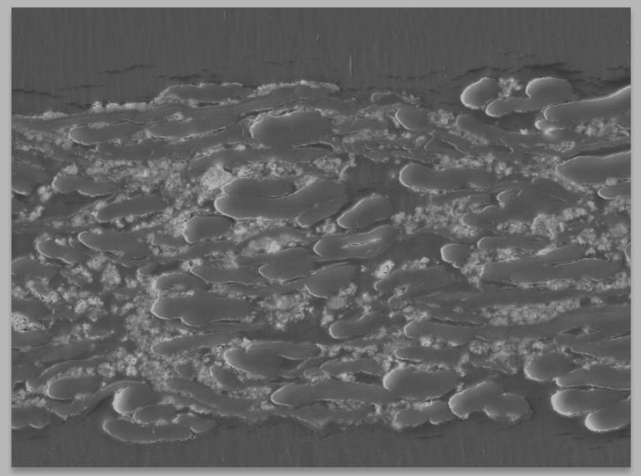


MFC in Base Paper	Base Paper Porosity (Bendtsen, ml/min)	Base Paper Porosity (Gurley, Sec/100 ml)
0%	2633	4
2%	1591	7

- Less coating penetration when using MFC due to smoother and more closed surface structure of the base.
  - Equivalent properties at lower coat weights when using MFC.
    - Typically, for every 1% MFC, coat weight can be reduced by up to 10-15%.
  - Improved properties at equal coat weight (added value).
- **Applications: Graphic, barrier & specialty.**

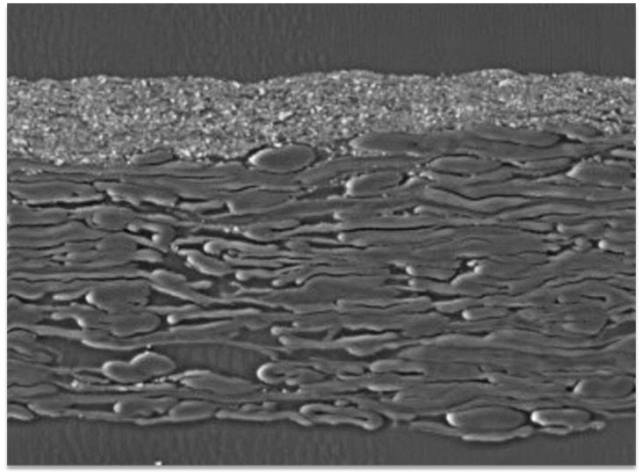
MFC applications in paper and board

In the sheet…
“Internal application”



- MFC is mixed into the pulp stock to provide increased web bonding.

On the sheet…
“Surface application”



- MFC is coated onto the surface to improve barrier properties.
- Or where MFC is used as the sole binder for a mineral coating.

"Surface application" of MFC: Wet End Coating

MFC applied at the paper machine wet end:

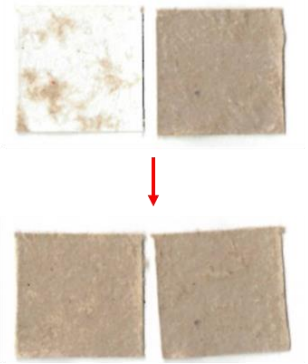
- Drain, press and dry using existing paper machine equipment.
- Low CapEx requirement.
- Convert existing production lines to new grades.
- 2-layer sheet functionality achieved with 1 forming section and no coaters.
- Patented technology.

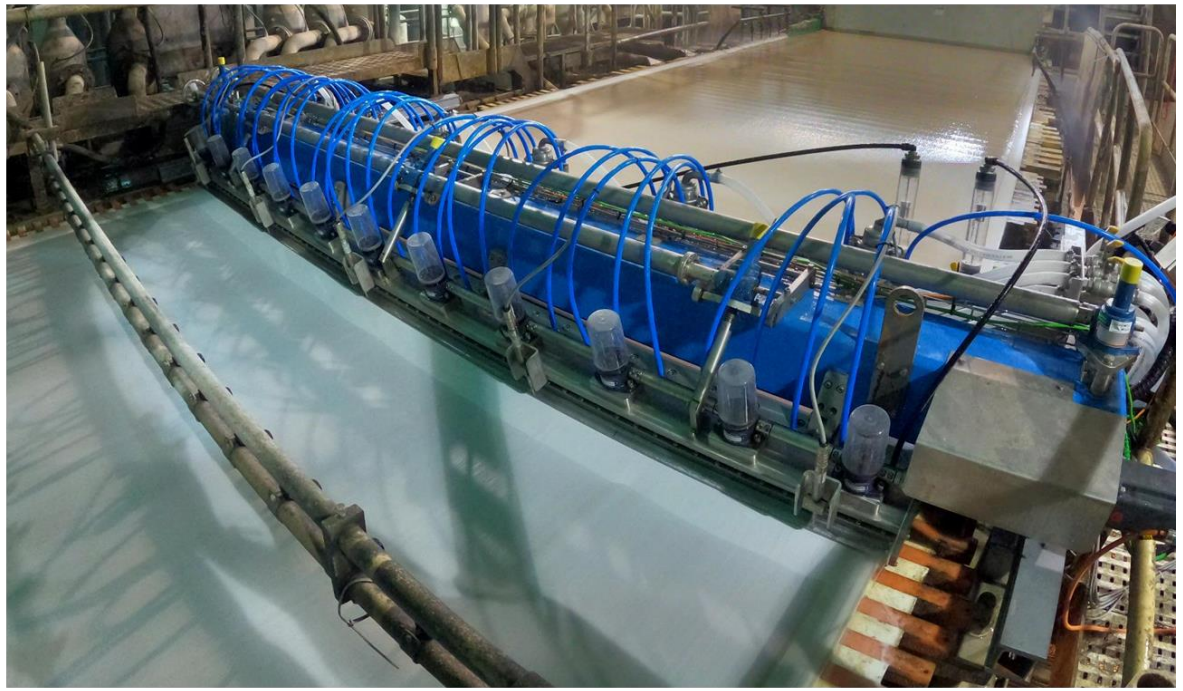
Multiple application uses:

White Top Liner

Barrier

Interlayer Bonding





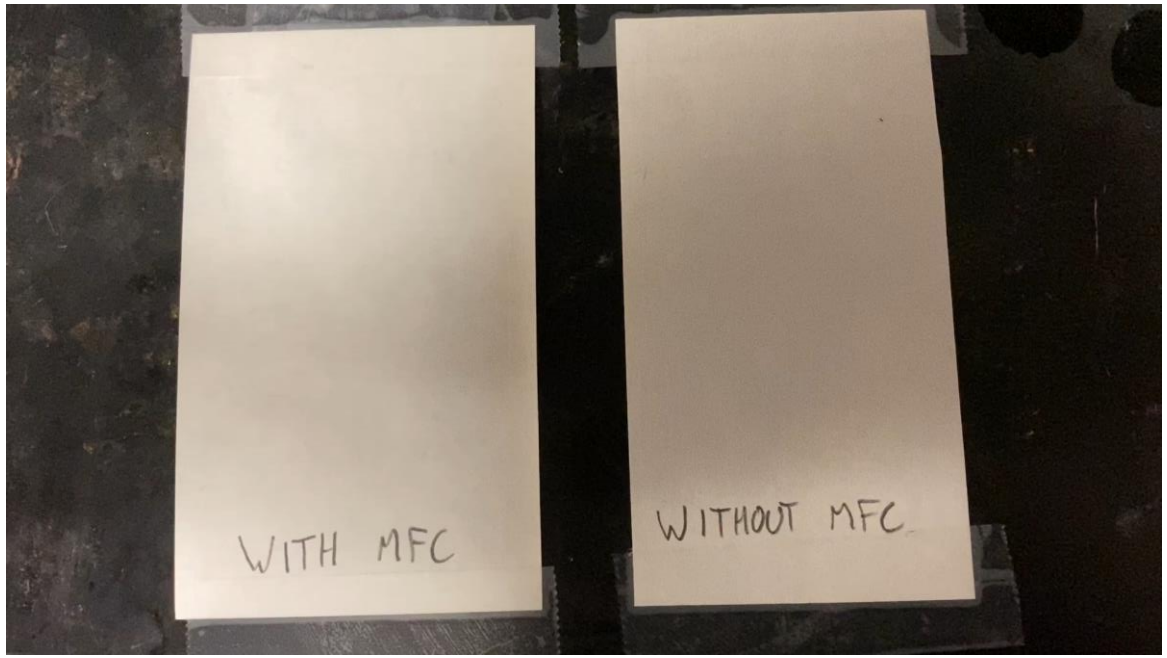
Commercial-scale application of MFC:

3 m wide paper machine operating at 500 m/min.

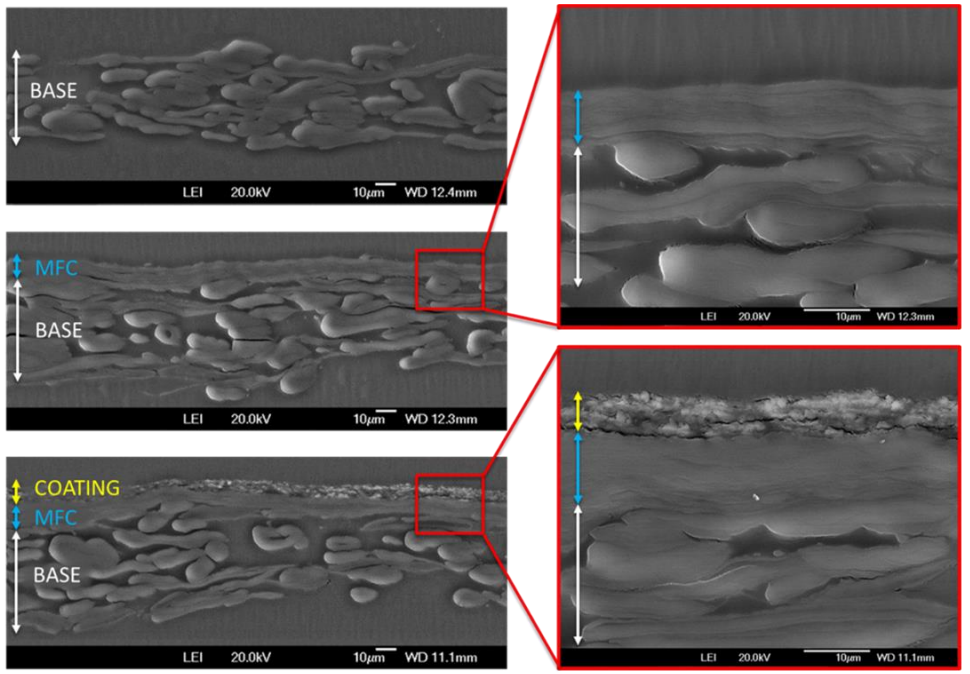
3 m wide applicator available now for trials

4.5 m wide applicator under construction

MFC applied *via* wet end coating provides many interesting properties for barrier products



KIT 12 oil solution being applied to paper surfaces.



Cross-section Imaging: Scanning Electron Microscopy (SEM)

- ✓ Oil & grease resistance.
- ✓ Oxygen & aroma barrier.
- ✓ Mineral oil barrier.
- ✓ Very smooth & closed surface.
- ✓ Precoated surface for top coatings.
- ✓ High-strength & durable layer.
- ✓ High bio-based content, sustainable packaging.
- ✗ MFC is not a water/moisture barrier.

- MFC remains on the surface, forming a fibril-film.
- The MFC layer has a very closed structure, preventing penetration of oil and permeability of air.
- The surface serves as a substrate (primer) for subsequent coatings (i.e., topcoats to achieve moisture / water barrier).

Innovation with fibre-based barrier packaging to replace plastics is critical for a more sustainable future

Drivers:

- Consumer awareness
- Single-use plastics directive (SUPD)
- Reduction of petroleum-derived materials use
- PFAS bans
- Demand for sustainability (recyclable, biodegradable and compostable bio-based packaging)
- Natural-themed packaging is on trend

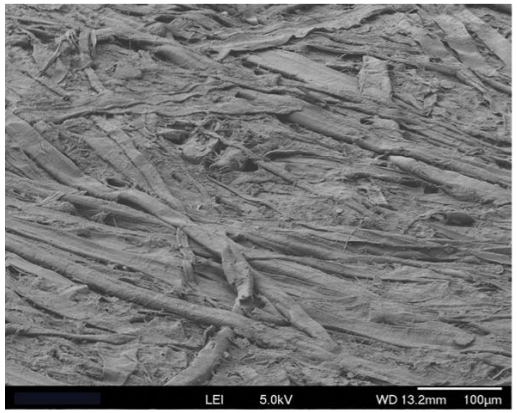
"As governments and brands increasingly look for alternatives to plastic packaging and food service formats, the paper and board sub-segment will assume an increasingly critical role."

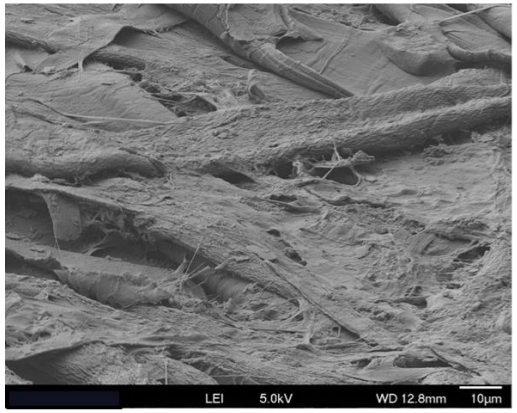
Smithers, 2019

'The Future of Functional & Barrier Coatings for Paper & Board to 2024'

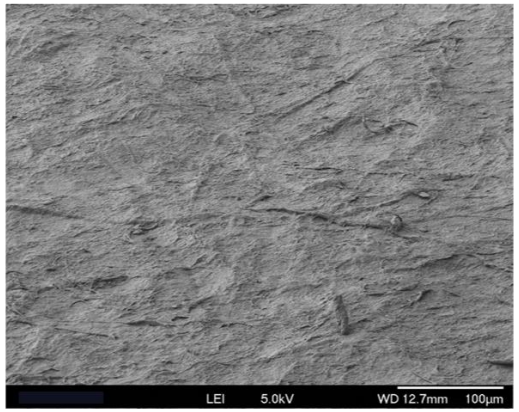
Scanning Electron Microscope (SEM) Imaging of MFC coated papers

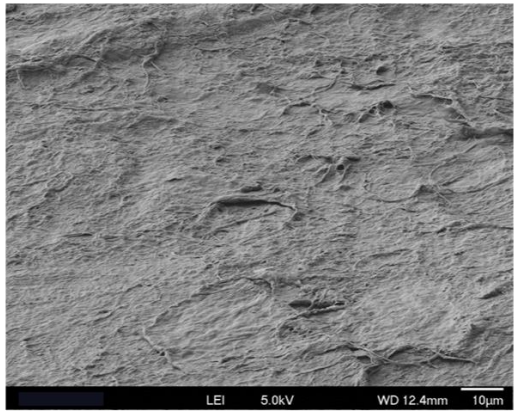
0 g/m² (No coating)



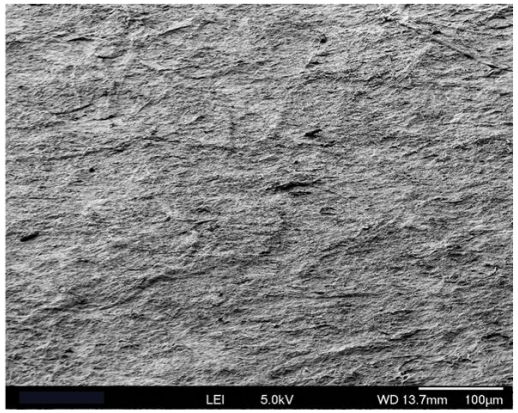


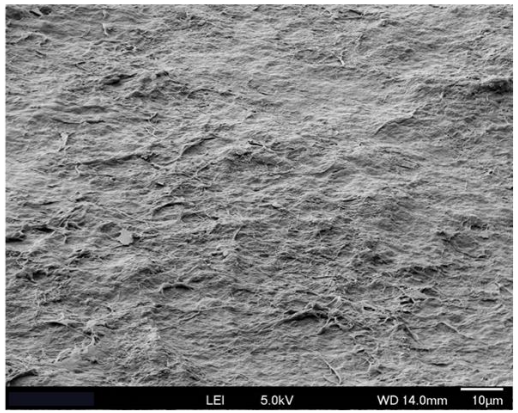
4 g/m² (MFC coating)





12 g/m² (MFC coating)





- The lowest coat weight, 4 g/m² provided substantial changes to the surface topography and structure.
- By 12 g/m², the MFC has formed a film and reached sufficient thickness to achieve high barrier properties.

Barrier Application Results – MFC applied by wet end coating

Pilot Prototype Paper 1: Oil & Grease / Mineral Oil Barrier

- 50 g/m² Base paper coated with only MFC.
- Between 8 to 12* g/m² MFC applied at the wet end.

Oil & Grease
KIT Rating = 12
23 ℃, 50% R.H. (0-12)

Mineral Oils (MOSH & MOAH)
HVTR = < 5
23 ℃, 50% R.H. (n-Heptane, g/m² d⁻¹)

Oxygen Barrier
OTR = 40 to 100
23 ℃, 50% R.H. (cm³ d⁻¹ m⁻² bar¹)

High Strength & Durability
Fold / cracking endurance

Smooth & Closed Surface
Precoat / primer layer for other top coats

>99% Bio-based
Mono-material packaging

Recyclable
With Paper & Cardboard
PTS-RH Method 021:202

Biodegradable
With no persistence
Certification in progress

*MFC coat weight required depends on substrate roughness/formation and desired properties.

Barrier Application Results – MFC applied by wet end coating

Pilot Prototype Paper 2: Prototype 1 + Moisture / Water Resistance

- 50 g/m² Base paper coated with 10 g/m² MFC.
- 1-stage coating step of a water-based barrier coating (6 g/m²).

Oil & Grease
KIT Rating = 12
23 °C, 50% R.H. (0-12)

Mineral Oils (MOSH & MOAH)
HVTR = < 5
23 °C, 50% R.H. (n-Heptane, g/m² d⁻¹)

Oxygen Barrier
OTR = 200 to 500
23 °C, 50% R.H. (cm³ d⁻¹ m⁻² bar¹)

High Strength & Durability
Fold / cracking endurance

Water Barrier
COBB 60 = < 0.8
23 °C, 50% R.H. (g/m²)

Functionality added by top coat

Smooth & Closed Surface
Precoat / primer layer from MFC

>90% Bio-based
Packaging complex

Recyclable
Packaging complex

Biodegradable
Packaging complex

Moisture Barrier
MVTR = < 7
23 °C, 50% R.H. (g/m² d⁻¹)

Barrier Application Results – MFC applied by wet end coating

Pilot Prototype Paper 3: Full Barrier With Improved Oxygen Barrier

- Initial results - Under development.

Oil & Grease
KIT Rating = 12
23 ℃, 50% R.H. (0-12)

Mineral Oils (MOSH & MOAH)
HVTR = < 5
23 ℃, 50% R.H. (n-Heptane, g/m² d⁻¹)

Oxygen Barrier
OTR = 10 to 30
23 ℃, 50% R.H. (cm³ d⁻¹ m⁻² bar¹)

High Strength & Durability
Fold / cracking endurance

Water Barrier
COBB 60 = < 0.8
23 ℃, 50% R.H. (g/m²)

Functionality added by top coat

Smooth & Closed Surface
Precoat / primer layer from MFC

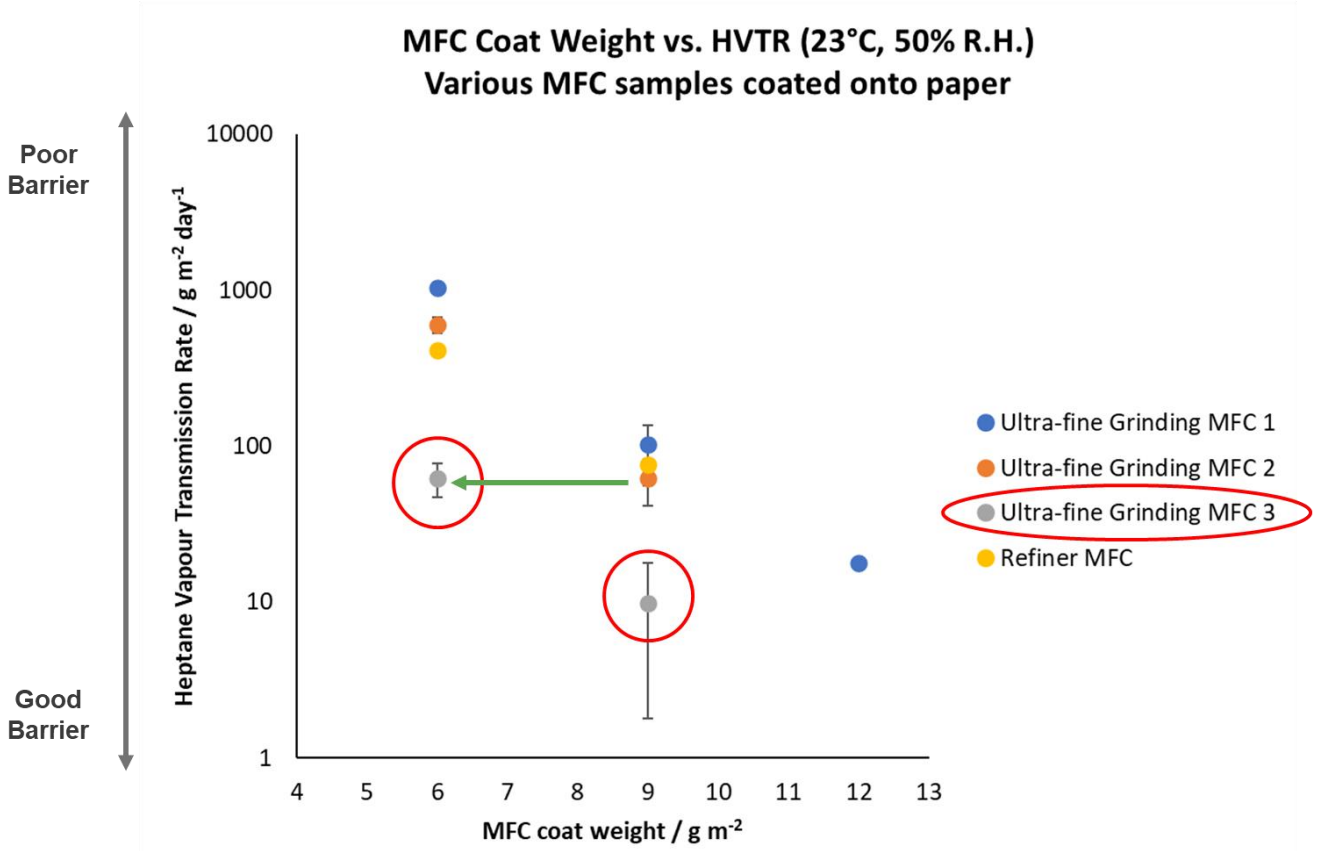
>87% Bio-based
Packaging complex

Recyclable
Packaging complex

Biodegradable
Packaging complex

Moisture Barrier
MVTR = < 7
23 ℃, 50% R.H. (g/m² d⁻¹)

MFC properties are critical for effective application and high-performance

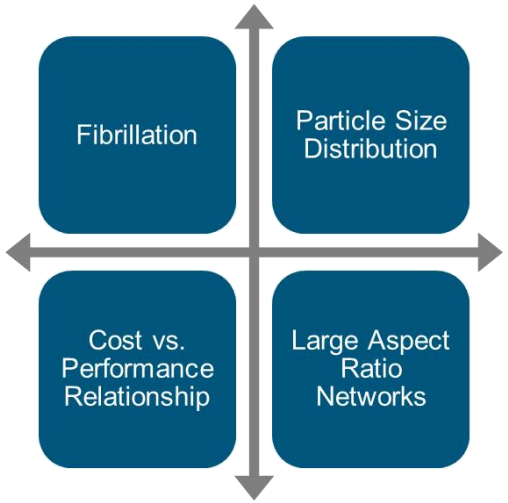


HVTR = Heptane Vapour Transmission Rate; is a barrier / permeation test method to evaluate the transmission rate of a volatile organic compound (n-Heptane), acting as a mineral oil simulant, through paper and plastic packaging materials.

○ = Product recommended for barrier MFC surface application.

✓ **Significantly lower coat weight required or higher performance.**

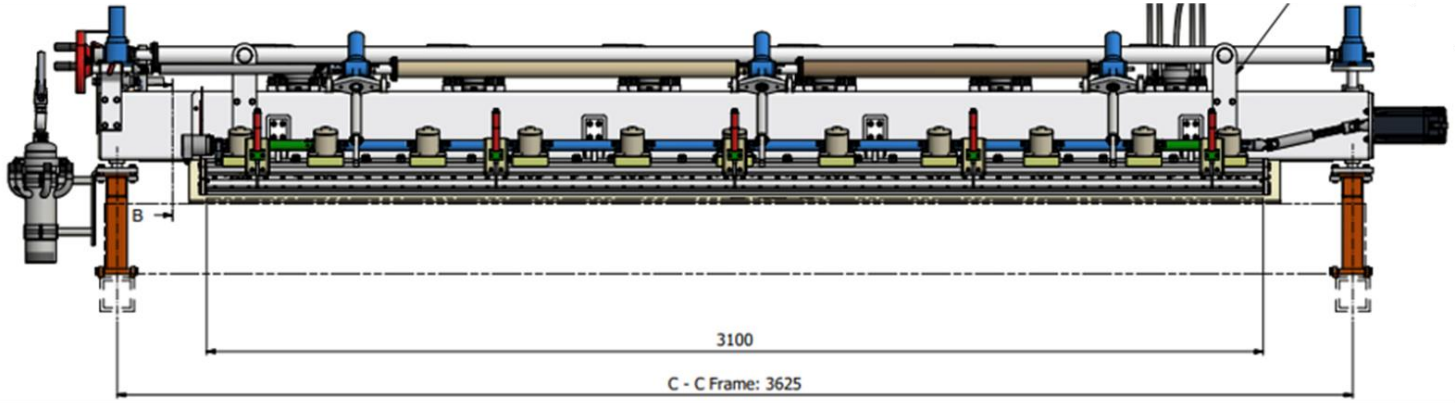
Tailored MFC Properties for Wet End Coating



- Barrier performance
- Strength / Durability
- Network bridging / film-forming
- Porosity control
- Surface hold-out
- Binding capability
- Viscosity & Drainage

- Avoidance of applicator blockages
- Coating uniformity / formation
- Process throughput to match peak demand
- Dose / Coat weight required
- Cost effectiveness

Wet end applicator: Designed for MFC



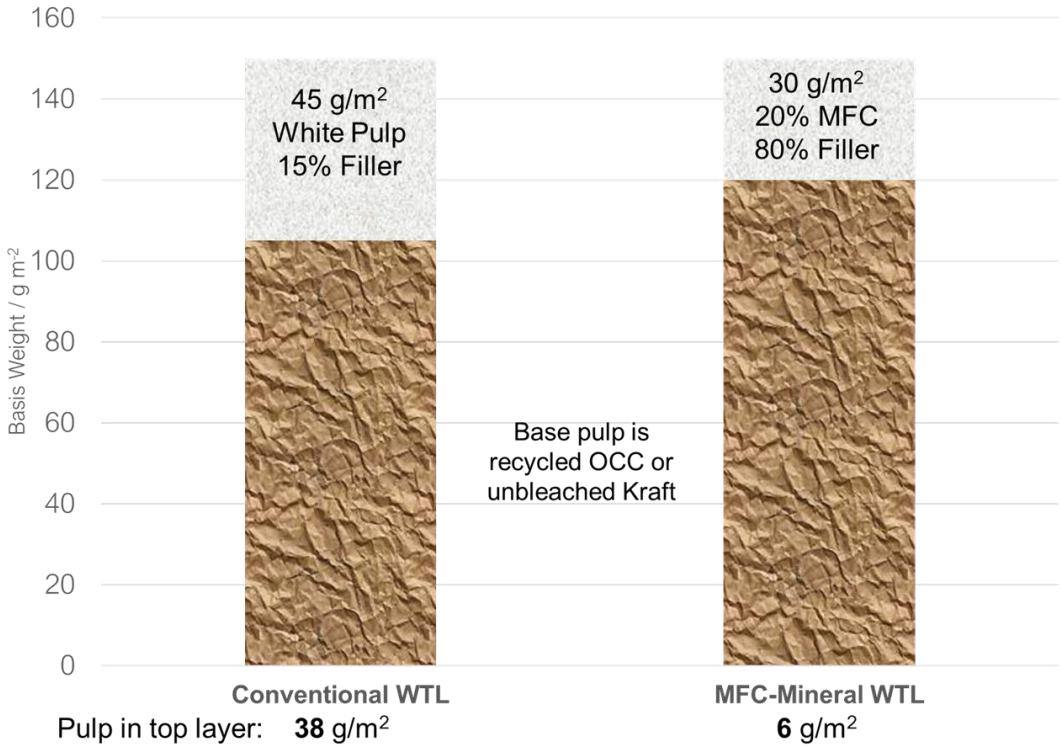
1/10000 sec exposure photographs

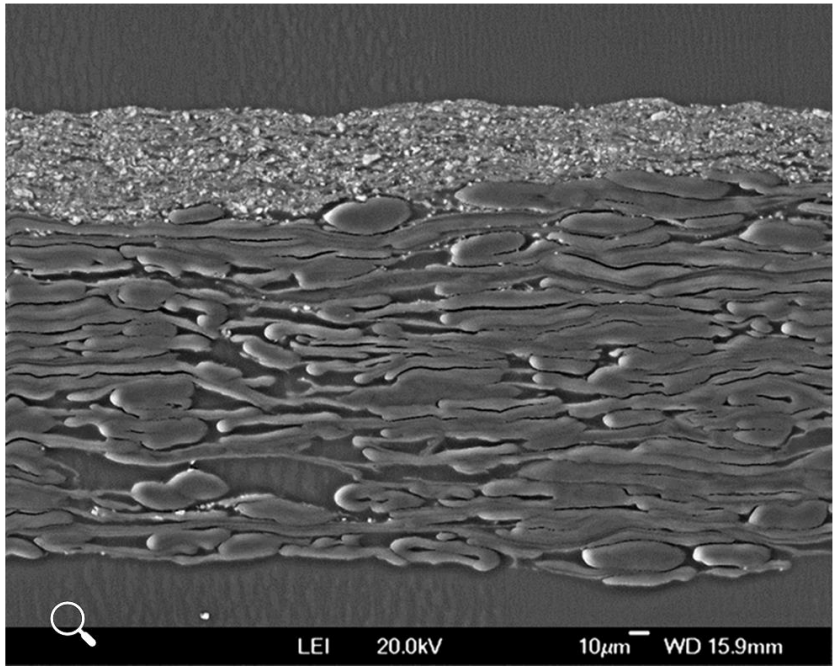
Water, 500 m/min

20/80 MFC/$CaCO_3$ 500 m/min

- Designed for application of optimized MFC with jet speed similar to wire speed, i.e., at high-shear conditions. Gradual shear-thinning of MFC through the approach flow system and applicator with maintained laminar flow.
- Easy mounting across paper machine.

Wet end coating of MFC-mineral composites:
A new way to convert from brown liner to White Top





- ✓ Low-cost layer comprising mostly minerals, with MFC as the only binder.
- ✓ Absolute minimal white pulp consumption to produce WTL.
- ✓ Smoothness and printing properties.
- ✓ High surface strength and delamination resistance.

- Mineral particles provide a bright, white, printable surface to uniformly cover the dark base.
- MFC binds mineral particles at the surface, ensuring no penetration into the base and high surface strength.

Summary

- Ultra-fine grinding achieves a low-cost and high-performance MFC at scale.
- MFC is increasingly more widely established as a key tool in the paper makers toolkit, enabling its users to:
  - Improve properties.
  - Reduce costs.
  - Achieve their sustainability goals.
  - Develop new products.
- Wet-end coating of MFC can be used to achieve totally new properties on existing paper production lines with minimal investment cost.
